(57) ABSTRACT

A wetting apparatus (110) for wetting a hydrophilic urinary catheter (103) comprises a wetting receptacle (101) which defines a wetting fluid receiving area (102) for receiving the hydrophilic urinary catheter and a hydrophilic urinary catheter wetting fluid container (106) having a discharge outlet (126) movable from a closed position to an open position on application of a predetermined condition thereto to enable the wetting fluid to be discharged from the wetting fluid container. The wetting fluid container provided can be positioned in the wetting receptacle in an operational position in which at least the discharge outlet of the wetting fluid container is disposed within the bounds of the wetting receptacle, the wetting receptacle being so constructed and the wetting fluid container being so disposed relative to the wetting receptacle when in the operational position that application of the predetermined condition to the discharge outlet of the wetting fluid container when in the operational position enables the wetting fluid to be discharged into the wetting fluid receiving area for wetting of the hydrophilic urinary catheter.

HYDROPHILIC URINARY CATHETER HAVING A WATER-CONTAINING SACHET

CROSS REFERENCE TO RELATED APPLICATIONS

This is a continuation of, commonly assigned U.S. patent application Ser. No. 10/160,390, filed May 31, 2002, now U.S. Pat. No. 6,736,805, which is a continuation of commonly-assigned U.S. patent application Ser. No. 08/809,481, 10 filed Mar. 21, 1997 now U.S. Pat. No. 6,409,717 as the United States national phase of International Patent Application No. PCT/SE97/00096, now U.S. Pat. No. 6,409,717, each of which is hereby incorporated by reference in its respective entirety.

BACKGROUND OF THE INVENTION

The present invention relates to wetting apparatus for wetting of hydrophilic urinary catheters comprising a wetting receptacle which defines a wetting fluid receiving area which is adapted to receive a hydrophilic urinary catheter and a hydrophilic urinary catheter wetting fluid container having a discharge outlet movable from a closed position to an open position on application of a predetermined condition thereto to enable the wetting fluid to be discharged from the wetting fluid container into the wetting fluid receiving area for wetting of the hydrophilic urinary catheter. The present invention further relates to a fluid container of a type which may be used in such apparatus.

Intermittent self-catheterisation is widely employed by patients suffering from for example strictures or traumas in the urinary system as well as by paralysed patients to enable the patients to live a nearly normal home life. Urinary catheters supplied for intermittent self-catheterisation in 35 general need to have a lubricant applied to the outer surfaces thereof to facilitate insertion into the urethra. For example, hydrophilic urinary catheters have a hydrophilic outer surface coating which should be wetted by a fluid such as water or saline for a certain time period prior to insertion thereof 40 into the urethra of a patient for lubrication purposes.

Various methods for lubricating urinary catheters have been previously proposed, examples of which are given below.

Prior U.S. Pat. No. 5,209,726 makes known a self-45 lubricating urinary catheter and a method for self-catherisation. The catheter has an annular lubricant reservoir surrounding an inner tube having perforations. As the catheter is inserted into the urethra of a patient lubricant is forced from the reservoir into the inner tube and out into the urethra 50 through a discharge outlet in the catheter. Lubrication of the outer surface of the catheter therefore only takes place as the catheter is being inserted into the urethra of the patient resulting in at least some initial discomfort for the patient on insertion of the catheter.

Prior U.S. Pat. No. 3,967,728 makes known a catheter package comprising a urinary catheter and a rupturable, lubricant containing pouch. One edge of the pouch is located within the package adjacent to the tip of the catheter and the seal at that edge is made so that it ruptures when the pouch is squeezed thereby to lubricate the tip of the catheter. As only the tip of the catheter is lubricated the patient will still suffer discomfort on insertion of the catheter into the urethra.

Prior UK patent application publication No. 2284764 makes known a catheter and urine collection bag assembly comprising (i) a catheter having a shaft with a rounded tip, a drainage aperture in the tip and a flared portion to the rear

2

of the shaft, and (ii) a urine collection bag within which the catheter is disposed and which at a forward end is formable with an aperture which is sufficiently large to permit the tip and shaft of the catheter to pass through but small enough for the flared portion of the catheter to engage therewith to form a mechanical seal against leakage of urine. Once the catheter has been extended through the aperture it is ready to be inserted into the urethra of a patient. Urine is transported rearwardly through the catheter from the bladder of the patient for collection in the urine collection bag. It is disclosed that a separate, burstable container containing a lubricious substance may be included within the urine collection bag for lubricating the catheter. No details are given, however, of the construction of the container nor of the disposition of the container relative to the catheter.

Applicant's prior International patent application publication No. WO86/06284 discloses a wetting and storage device for a hydrophilic urinary catheter. A wetting pocket is provided, closed at one end so that it may be filled with a wetting liquid and a hydrophilic urinary catheter is then introduced into the pocket for wetting thereof. No liquid container, though, is provided in the device for releasing wetting liquid into the pocket immediately prior to use of the catheter. Wetting liquid for the pocket therefore has to be supplied separately by the patient. This is inconvenient because a sterile supply of wetting liquid is not necessarily always on hand to the patient and there is a marked possibility of spillage of the wetting liquid.

The hitherto proposed lubricating apparatus for urinary catheters discussed above have the drawback that they make no or inadequate provision for lubricating hydrophilic urinary catheters. As an example, the lubricating arrangements made known in U.S. Pat. No. 3,967,728 and UK patent application publication No. 2284764 are for catheters of non-hydrophilic character, the lubricant therefore being a gel which is unsuited for lubricating a hydrophilic catheter. The prior lubricating apparatus therefore fail to provide an integrated supply of hydrophilic urinary catheter wetting fluid let alone an integrated supply of hydrophilic urinary catheter wetting of the insertable length or substantially the insertable length of a hydrophilic urinary catheter prior to insertion of the catheter into the urethra of a patient.

Patients using hydrophilic urinary catheters accordingly require improved means for lubricating the catheters. The present invention therefore proposes to address this requirement.

SUMMARY OF THE INVENTION

According to a first aspect of the invention there is provided a wetting apparatus for wetting a hydrophilic urinary catheter comprising a wetting receptacle which defines a wetting fluid receiving area for receiving a hydro-55 philic urinary catheter and a hydrophilic urinary catheter wetting fluid container having a discharge outlet movable from a closed position to an open position on application of a predetermined condition thereto to enable the wetting fluid to be discharged from the wetting fluid container, the wetting fluid container being integrated with the wetting receptacle in an operational position in which at least the discharge outlet of the wetting fluid container is disposed within the bounds of the wetting receptacle, the wetting receptacle being so constructed and the wetting fluid container being so disposed relative to the wetting receptacle when in the operational position that application of the predetermined condition to the discharge outlet of the wetting fluid con-

tainer when in the operational position enables the wetting fluid to be discharged into the wetting fluid receiving area for wetting of the hydrophilic urinary catheter and the wetting fluid receiving area being adapted such that the insertable length or substantially the insertable length of the 5 hydrophilic urinary catheter is wetted by the wetting fluid discharged into the wetting fluid receiving area.

By "integrated" is meant that the wetting fluid container and wetting receptacle are formed into a one-piece unit, that is to say, the wetting fluid container is supported on or by the 10 wetting receptacle.

An "on tap" supply of lubricant for the hydrophilic urinary catheter is therefore available to the patient and the problem of possible spillage of the wetting fluid alleviated. Furthermore, an increased comfort on insertion of the catheter into the urethra results due to the insertable length or substantially the insertable length of the catheter being lubricated prior to insertion.

According to a second aspect of the invention there is provided a wetting apparatus for wetting a hydrophilic urinary catheter comprising a wetting receptacle which defines a wetting fluid receiving area for receiving a hydrophilic urinary catheter and a hydrophilic urinary catheter wetting fluid container having a discharge outlet movable from a closed position to an open position on application of a predetermined condition thereto to enable the wetting fluid to be discharged from the wetting fluid container, the wetting fluid container being integrable with the wetting receptacle in an operational position in which at least the discharge outlet of the wetting fluid container is disposed within the bounds of the wetting receptacle, the wetting receptacle being so constructed and the wetting fluid container being so disposed relative to the wetting receptacle when in the operational position that application of the predetermined condition to the discharge outlet of the wetting fluid container when in the operational position enables the wetting fluid to be discharged into the wetting fluid receiving area for wetting of the hydrophilic urinary catheter. The problem of possible spillage of the wetting fluid is also alleviated in this case and manufacture, packaging and transport of the apparatus simplified.

In a preferred embodiment of the invention the wetting fluid is water or a saline solution.

In an embodiment of the invention hereinafter to be 45 described the wetting fluid receiving area is an elongate pocket of length sufficient to accommodate at least the insertable length of the hydrophilic urinary catheter and the wetting fluid container is adapted to contain sufficient wetting fluid to fill the pocket to a level for wetting at least the 50 insertable length of the hydrophilic urinary catheter.

In a preferred embodiment of the invention hereinafter to be described the wetting receptacle is a urine collection bag, the elongate pocket forms the forward portion of the urine collection bag and presents an open rear end and a weakened 55 closed forward end which is removable upon application of a predetermined pressure thereto thereby to enable a portion of the hydrophilic urinary catheter comprising at least the insertable length thereof to be projected through the forward end of the pocket after wetting thereof for insertion into the 60 urethra of a patient and the urine collection bag further comprises a urine collection chamber to the rear of the elongate pocket, the urine collection chamber having a forward end which is in fluid communication with the open rear end of the pocket and being adapted in use to collect 65 urine transported rearwardly through the hydrophilic urinary catheter after insertion thereof into the urethra of the patient.

4

A typical sterilising agent which could be used for sterilising the wetting apparatus of the invention is ethylene oxide. Moreover, the fluid in the fluid container would normally be sterile. For these reasons, the wetting fluid container is preferably made of a material which is impermeable or substantially impermeable to ethylene oxide as well as the fluid contained therein. Non-limiting examples of materials satisfying this condition when the fluid is water or saline are aluminium foil, poly(vinylidene chloride) or a metallised film such as metallised poly(ethylene terepthalate).

In an embodiment of the invention hereinafter to be described the wetting fluid container is fully contained within the bounds of the wetting receptacle and may be permanently fixed to the inner surface of the wetting receptacle.

In an embodiment of the invention the wetting fluid container is an integrally formed compartment of the wetting receptacle.

In an embodiment of the invention hereinafter to be described the wetting receptacle is formed of a flexible material and the discharge outlet is brought to the open position through application of a predetermined force to the wetting fluid container through the material of the wetting receptacle.

In an embodiment of the invention hereinafter to be described the wetting receptacle is provided with an inlet which is in fluid communication with the wetting fluid receiving area and the wetting fluid container is integrable with the wetting receptacle in the operational position by insertion of at least a forward portion thereof in the inlet, the forward portion of the wetting fluid container presenting the discharge outlet.

In an embodiment of the invention hereinafter to be described the wetting fluid container is integrable with the wetting receptacle in the operational position through a friction fit between the wetting fluid container and the inlet of the wetting receptacle.

According to a third aspect of the invention there is provided a fluid container for use with a receptacle having an inlet and a fluid receiving area in fluid communication with the inlet, the fluid container comprising a forward portion which is adapted to be positioned in the inlet of the receptacle and comprises a discharge outlet movable on application of a predetermined condition thereto from a closed position in which the fluid is retained in the fluid container to an open position in which the fluid is dischargeable forwardly from the forward portion of the fluid container, the predetermined condition able to be applied to the discharge outlet when the forward portion of the fluid container is positioned in the inlet to enable the fluid contained in the fluid container to be discharged into the fluid receiving area of the receptacle. The fluid container therefore alleviates the problem of spillage on discharge of the contents into the fluid receiving area.

In an embodiment of the invention according to its third aspect hereinafter to be described the fluid container is for use with a receptacle whose fluid receiving area is adapted in use to receive a hydrophilic urinary catheter and the fluid container contains a fluid which on discharge into the fluid receiving area wets the hydrophilic coating of the catheter.

In an embodiment of the invention hereinafter to be described the fluid container comprises predetermined condition applying means for applying the predetermined condition to the discharge outlet to bring the discharge outlet to the open position.

In an embodiment of the invention hereinafter to be described the forward portion of the fluid container is positioned in the inlet of the receptacle when the fluid container is in the operational position, the fluid container comprises a rearward portion which in the operational 5 position of the fluid container projects from the inlet of the receptacle and the rearward portion comprises at east a part of the predetermined condition applying means.

In an embodiment of the invention hereinafter to be described the discharge outlet comprises an area of weak- 10 ness in the material of the forward portion of the fluid container which on application of a predetermined force thereto is brought to the open position.

In an embodiment of the invention hereinafter to be described the at least a part of the predetermined condition 15 applying means comprised of the rearward portion of the fluid container is a tab which on application of a predetermined pulling force thereto causes the predetermined force to be applied to the area of weakness in the material of the forward portion of the fluid container.

In an embodiment of the invention hereinafter to be described the area of weakness in the material of the forward portion of the fluid container is a tear line which is tom on application of the predetermined pulling force to the tab. The predetermined condition applying means further comprises 25 holding means for holding the fluid container in the operational position against the action of the predetermined pulling force applied to the tab.

In an embodiment of the invention hereinafter to be described the receptacle is of a flexible material and the 30 holding means is provided on the forward portion to be gripped by a user through the material of the receptacle when the fluid container is in the operational position.

In an embodiment of the invention hereinafter to be described the forward portion of the fluid container presents 35 a forward edge, the tear line extends rearwardly from the forward edge, the tab is a first tab which extends rearwardly from the forward edge of the forward portion on a first side of the tear line and is of such dimensions that when the fluid container is in the operational position the first tab projects 40 from the inlet of the receptacle, the holding means for holding the fluid container in the operational position against the action of the pulling force applied to the first tab is a second tab which extends forwardly from the forward edge on a second opposite side of the tear line and application of 45 ratus 10 according to the invention comprising a urine a predetermined rearward pulling force on the first tab relative to the second tab causes the tear line to tear and the fluid to be dischargeable from the fluid container into the fluid receiving area of the receptacle.

In embodiments of the invention hereinafter to be 50 described the fluid container takes the form of a sachet.

In an embodiment of the invention according to its third aspect hereinafter to be described the fluid container is adapted to be integrated with the receptacle by friction fit in the inlet of the receptacle to maintain the fluid container in 55 the operational position. An integrated unit is thus obtained having the benefits of the apparatus according to the first and second aspects of the invention.

In an embodiment of the invention according to its third aspect the fluid container contains water or saline and is 60 made of aluminium foil, poly(vinylidene chloride) or a metallised film such as metallised poly(ethylene tereptha-

The present invention has the advantage of providing a safe, compact, sterile and disposable wetting apparatus for a 65 hydrophilic urinary catheter which is easy to handle. This is due to the provision of a wetting fluid container component

6

part which is adapted to cooperate with a wetting receptacle component part of the apparatus so as to be able to release its contents into the wetting receptacle to wet a hydrophilic urinary catheter placed therein under clean conditions, that is to say, without the need for touching of the catheter, fluid or inner surface of the wetting receptacle thereby avoiding or alleviating the risk of introducing contaminants.

BRIEF DESCRIPTION OF THE DRAWINGS

By way of example embodiments of the invention will now be described with reference to the accompanying drawings in which:

FIG. 1 shows a wetting apparatus according to a first embodiment of the invention comprising a urine collection bag and a wetting fluid container integrated therewith;

FIG. 2 shows a wetting apparatus according to a second embodiment of the invention comprising a urine collection bag and an unopened wetting fluid sachet in accordance with the invention integrated therewith in an operational position in the inlet of the urine collection bag;

FIG. 3 is an exploded view of the unopened sachet of the wetting apparatus shown in FIG. 2 in the operational position in the inlet of the urine collection bag;

FIG. 4 is a front view of the unopened sachet of the wetting apparatus shown in FIG. 2 in an extended configuration prior to insertion thereof into the inlet of the urine collection bag to the operational position;

FIG. 5 is a side view of the unopened sachet shown in FIG. 4;

FIG. 6 is a perspective view of the unopened sachet of the wetting apparatus shown in FIG. 2 in a retracted configuration ready for insertion into the inlet of the urine collection bag to the operational position;

FIG. 7 corresponds to FIG. 2 but with the wetting fluid sachet having been opened; and

FIG. 8 corresponds to FIG. 3 but with the wetting fluid sachet having been opened.

DETAILED DESCRIPTION OF THE INVENTION

Referring first to FIG. 1, there is shown a wetting appacollection bag 1 of a transparent flexible plastics material. The bag 1 presents at the forward end thereof an elongate pocket 2 of depth sufficient to receive at least the insertable length of a hydrophilic urinary catheter 3. The urine collection bag 1 further defines to the rear of the pocket 2 a urine collection chamber 12 which is in fluid communication with the pocket 2. Further rearwardly is an inlet 14 to the urine collection bag 1 through which the hydrophilic urinary catheter 3 is able to be introduced into the bag 1.

As can be seen, the catheter 3 comprises a flared rearward portion 16 and an elongate shaft 18 which extends forwardly from the rearward portion 16 and terminates in a rounded tip 4 at the forward end thereof. The catheter 3 is provided with a lumen (not shown) which extends from an open end in the rearward portion 16 to a drainage aperture 5 in the tip 4.

A container in the form of a sachet 6 is secured to the inner surface of the urine bag 1. The sachet 6 contains sterile water or saline or other fluid suitable for wetting the hydrophilic urinary catheter 3 and is pierceable or otherwise openable, for example by applying a hand pressure, so as to release substantially all of the water or saline contained therein into the pocket 2 immediately prior to use of the catheter 3.

Typically, the urine collection bag 1 with integrated sachet 6 and, where pre-packaged therewith, the catheter 3 will be sterilised using ethylene oxide. Since the sachet 6 contains sterile water or saline there is no need for sterilising the contents of the sachet 6. Accordingly, the material of the 5 sachet 6 is preferably impermeable to ethylene oxide and water. Non-limiting examples of materials meeting these requirements are poly(vinylidene chloride) (PVDC), aluminium foil laminates and metallised films, for example metallised poly(ethylene terepthalate). Other sterilisation 10 processes could of course be used instead, for example by irradiation in which case the fluid in the sachet 6 could be sterilised in situ at the same time as the rest of the components of the apparatus 10.

The volume of the sachet 6 is sufficient to release such an amount of water or saline into the pocket 2 to enable wetting of the insertable length of the catheter 3 immediately prior to use. By "insertable length" is meant at least that length of the elongate shaft 18 which is coated with a hydrophilic material, for example PVP, and inserted into the urethra of 20 the patient. Typically, this will be 80–140 mm for a female patient and 200–350 mm for a male patient.

The holding time of the catheter 3 in the pocket 2 may vary within a broad range but will typically amount to at least 30 seconds.

The location of the sachet 6 inside the bag 1 is not critical as long as the sachet 6 releases its contents into the pocket 2. It is preferred, though, that the sachet 6 be disposed as close to the open end of the pocket 2 as possible. In this embodiment the sachet 6 is permanently fixed in position in 30 the urine collection bag 1, for example by adhesion to the bag 1. It will be appreciated, however, that the sachet 6 could in fact be freely movable in the bag 1. The fundamental point is that the sachet 6 is within the bounds of the bag 1 so that the two components form an integrated unit.

In use, the catheter 3 is introduced into the bag 1 through the inlet 14 and the elongate shaft 18 manoeuvred into the pocket 2 as shown. The inlet 14 is then sealed, for example by tying a knot in the material defining the inlet 14 or by clamping the inlet 14 with a clamp. The sachet 6 is then 40 opened, for example by applying a pressure thereto through the material of the bag 1, to release the wetting fluid into the pocket 2 and the catheter 3 left to soak for a predetermined duration in the wetting fluid to wet the hydrophilic outer surface thereof.

Alternately, the bag 1 may be provided with a closed end in place of the inlet with the catheter 3 pre-packaged inside the bag 1. An inlet 14 is preferred, though, where ethylene oxide is the sterilising agent as this provides a pathway for the ethylene oxide to enter and exit the inside of the bag 1. 50

After wetting of the catheter 3 for the predetermined duration the bag 1 is turned upside down and the forward-most portion of the pocket 2 torn off. The elongate shaft 18 of the catheter 3 is then manoeuvred through the opening in the forward end of the pocket 2 and into the urethra of the 55 patient until the flared rearward portion 16 forms a mechanical seal connection with the opening. There is therefore no need to directly handle the catheter 3 for insertion thereof into the urethra which is to advantage as the outer surface of the catheter 3 will be slippery due to the wetting procedure 60 and therefore difficult to grip and furthermore because the possibility of contamination of the catheter 3 at this stage is avoided.

Urine in the bladder of the patient is transported rearwardly through the lumen of the catheter 3 into the urine 65 collection chamber 12. The catheter 3 is manoeuvred back inside the bounds of the bag 1 and the open end of the pocket

8

2 closed off for example by tying a knot with the material defining the pocket 2 or clamping the pocket 2 with a clamp. An opening can then be made in the urine collection chamber 12 for the collected urine to be poured away after which the bag 1 can be disposed of.

Turning now to FIGS. 2 and 3 of the drawings, there is shown an alternative wetting apparatus 110 according to the present invention. The wetting apparatus 110 comprises a urine collection bag 101 of a flexible transparent plastics material which corresponds to the urine collection bag 1 of the wetting apparatus 10 hereinbefore described with reference to FIG. 1 of the drawings. That is to say, the urine collection bag 101 has a downwardly extending elongate pocket 102 at the forward end, a urine collection chamber 112 rearwardly of and in fluid communication with the elongate pocket 102 and an inlet 114 to the bag 101 spaced further rearwardly.

Again as in the wetting apparatus 10 hereinbefore described with reference to FIG. 1, a hydrophilic urinary catheter 103 having a flared rearward portion 116, an elongate shaft 118 projecting forwardly from the rearward portion 116 and an open-ended lumen (not shown) which extends from the rear end of the rearward portion 116 to a drainage aperture 105 in the rounded tip 104 at the forward end of the catheter 103 is able to be inserted into the urine collection bag 101 through the inlet 114 such that preferably at least the insertable length of the catheter 103 is received in the pocket 102.

As can be seen more particularly by reference to FIG. 3, a wetting fluid containing sachet 106 is inserted into the inlet 114 to an operational position in which it is held in place by a friction fit. The sachet 106 has a forward portion 120 which in the operational position of the sachet 106 projects forwardly into the inlet 114 and a rearward portion 122 which in the operational position projects rearwardly out of the inlet 114.

The sachet 106 is preferably made of aluminium foil, particularly when ethylene oxide is the sterilising agent for the apparatus 110 and the sachet contains sterile water or saline solution. Where ethylene oxide is the sterilising agent for the apparatus 110 the fit of the sachet 106 in the inlet 114 is not so tight as to prevent ethylene oxide from entering and exiting the inside of the bag 101 and sterilising the inner surface of the bag 101 and outer surfaces of the sachet 106 and catheter 103. The wetting fluid is retained in the sachet 106 by peripheral sealing of the sachet 106 as shown.

Referring now to FIGS. 4 and 5, the forward portion 120 of the sachet 106 presents a forward edge 124. Extending rearwardly from the forward edge 124 is a tear line 126. Projecting forwardly from the forward edge 124 of the sachet 106 to one side of the tear line 126 is a first tab 128. On the other side of the tear line 126 there is provided an elongate second tab 130 shown here in an extended position in which the second tab 130 projects forwardly from the forward edge 124.

As shown in FIG. 6, the elongate second tab 130 is movable about the forward edge 124 back on its self from the extended position shown in FIGS. 4 and 5 to a retracted position in which the second tab 130 extends rearwardly from the forward edge 124. When the second tab 130 is in the retracted position the sachet 106 is inserted into the inlet 114 to the operational position shown in FIGS. 2 and 3.

Returning now to FIGS. 2 and 3, it can be seen that the dimensions of the second tab 130 are such that when the sachet 106 is in the operational position a pulling portion 132 of the second tab 130 projects rearwardly from the inlet

114 of the urine collection bag 101 and forms a part of the rearward portion 122 of the sachet 106.

In FIGS. 7 and 8 there is shown the operation of the sachet 106 to release the contents of the sachet 106 into the pocket 102 to wet the hydrophilic outer coating of the catheter 103. 5 The user grips the first tab 128 through the flexible transparent plastics material of the bag 101 and then pulls rearwardly on the pulling portion 132 of the second tab 130 which projects from the inlet 114 to cause the tear line 126 to be torn and the wetting fluid to be released into the pocket 102 to wet the catheter 103. Preferably, the sachet 106 contains sufficient wetting fluid for the pocket 102 to be filled to a level which results in the insertable length of the catheter 103 being wetted.

After release of the wetting fluid into the pocket 102 the 15 sachet 106 is removed from the bag 101 and disposed of. The bag 101 and catheter 103 are then utilised in the manner hereinabove described for the wetting apparatus 10 shown in

If need be, the bag 101 can be a closed bag with the sachet 20 106 and catheter 103 pre-packaged within the bag 101. In this instance, the construction of the bag 101 is such that the sachet 106 can be opened in the aforementioned manner through the material of the bag 101.

The wetting apparatus 110 described hereinabove with 25 reference to FIGS. 2 to 8 has the advantage of inter alia (i) being environmentally friendly in the sense that where the sachet 106 is made of Al foil the sachet is able to be disposed of separately from the bag 101 thus facilitating recycling of the Al foil; and (ii) having a sachet 106 which can better 30 withstand the cyclical pressures which are typically exerted on wetting apparatus when packaged and subjected to a sterilising process as a consequence of the sachet 106 not having to be opened through application of a direct pressure thereto through the material of the bag 101 in which case a 35 significantly weakened sachet edge would be required as a high pressure could not be applied through the bag 101 without damaging the bag 101.

In the exemplary embodiments hereinabove described with reference to the Figures of drawings the supply of 40 said wetting fluid container is made of aluminum foil, wetting fluid for wetting of the hydrophilic urinary catheter takes the form of a separate sachet integrated into the wetting receptacle. It will be appreciated by those versed in the art that the supply could also take the form of an integrally formed chamber in the material of the wetting 45 receptacle without departing from the spirit of the invention.

The invention claimed is:

- 1. Wetting apparatus, for wetting a hydrophilic urinary catheter prior to use, comprising:
 - a wetting receptacle which defines a wetting fluid receiving space, said wetting fluid receiving space forming an elongate pocket having a volume therein;
 - a urinary catheter arranged in said wetting receptacle, said urinary catheter having an insertable length and having 55 a hydrophilic outer surface on at least said insertable length; wherein:
 - said elongate pocket accommodates said at least said insertable length of said catheter; said wetting apparatus further comprising:
 - a wetting fluid container containing a wetting fluid and having a discharge portion that opens upon application of a predetermined condition to said wetting fluid container to enable said wetting fluid to be discharged from said wetting fluid container; wherein:
 - said wetting fluid container is integrated with said wetting receptacle;

10

- at least said discharge portion of said wetting fluid container is disposed within said wetting receptacle;
- said discharge portion of said wetting fluid container is in fluid communication with said wetting fluid receiving space: and
- application of said predetermined condition to said wetting fluid container causes said wetting fluid to be discharged through said discharge opening into said wetting fluid receiving space and, thereby, to wet at least said insertable length of said hydrophilic urinary
- 2. The wetting apparatus according to claim 1, wherein said wetting fluid container contains sufficient wetting fluid to fill said elongate pocket to a level for wetting said at least said insertable length of said hydrophilic urinary catheter.
- 3. The wetting apparatus according to claim 2, wherein said wetting receptacle is a urine collection bag, and said elongate pocket forms a forward portion thereof.
- 4. The wetting apparatus according to claim 3, wherein said urine collection bag further comprises a urine collection chamber located at a rear portion of said elongate pocket, said urine collection chamber having a volume greater than said volume of said elongate pocket.
 - 5. The wetting apparatus according to claim 4, wherein: said elongate pocket of said urine collection bag presents an open rear end and a weakened closed forward end which is removable upon application of a predetermined pressure thereto thereby to enable a portion of said hydrophilic urinary catheter comprising at least said insertable length thereof to be projected through a forward end of said elongate pocket alter wetting thereof for insertion into the urethra of a patient; and
 - said urine collection chamber has a forward end which is in fluid communication with said open rear end of said elongate pocket and is adapted in use to collect urine transported rearwardly through said hydrophilic urinary catheter after insertion thereof into the urethra of said patient.
- 6. The wetting apparatus according to claim 1, wherein poly(vinylidene chloride) or a metallized film.
- 7. The wetting apparatus according to claim 6, wherein said metallized film comprises metallized poly(ethylene terephthalate).
- 8. The wetting apparatus according to claim 1, wherein said wetting fluid container is fully contained within said wetting receptacle.
- 9. The wetting apparatus according to claim 8, wherein said wetting fluid container is permanently fixed to an inner surface of said wetting receptacle.
- 10. The wetting apparatus according to claim 8, wherein said wetting fluid container is an integrally formed compartment of said wetting receptacle.
 - 11. The wetting apparatus according to claim 1, wherein: said wetting receptacle is formed of a flexible material;
 - said discharge portion of said wetting fluid container is able to be opened through application of a predetermined force to said wetting fluid container through said flexible material of said wetting receptacle.
- 12. The wetting apparatus according to claim 1, wherein said wetting fluid container is integrated with said wetting receptacle in a releasably secured manner.
- 13. The wetting apparatus according to claim 12, wherein; said wetting receptacle is provided with an inlet which is in fluid communication with said wetting fluid receiving area; and

- said wetting fluid container is releasably secured in said inlet of said wetting receptacle by insertion of at least a forward portion thereof in said inlet, said forward portion of said wetting fluid container presenting said discharge portion.
- 14. The wetting apparatus according to claim 13, wherein said wetting fluid container is releasably secured in said inlet of said wetting receptacle through a friction fit between said wetting fluid container and said inlet of said wetting receptacle.
- 15. The wetting apparatus according to claim 14, wherein said wetting fluid container comprises means for applying said predetermined condition to said discharge portion to open said wetting fluid container.
- **16**. The wetting apparatus according to claim **15**, wherein ¹⁵ said forward portion of said wetting fluid container is positioned in said inlet of said wetting receptacle; and
 - said wetting fluid container comprises a rearward portion which projects from said inlet of said wetting receptacle.
- 17. The wetting apparatus according to claim 16, wherein said rearward portion comprises at least a part of said means for applying said predetermined condition.
- 18. The wetting apparatus according to claim 17, wherein said discharge portion comprises an area of weakness in material of said forward portion of said wetting fluid container which on application of a predetermined force thereto opens.
- 19. The wetting apparatus according to claim 18, wherein at least a part of said means for applying said predetermined condition comprises a tab at said rearward portion of said wetting fluid container which on application of a predetermined pulling force thereto causes said predetermined force to be applied to an area of weakness in material of said forward portion of said wetting fluid container.
- 20. The wetting apparatus according to claim 19, wherein said area of weakness in said material of said forward portion of said wetting fluid container is a tear line which is adapted to be torn on application of said predetermined pulling force to said tab.
- 21. The wetting apparatus according to claim 20, wherein said means for applying said predetermined condition further comprises holding means for holding said wetting fluid container against action of said predetermined pulling force applied to said tab.
 - 22. The wetting apparatus according to claim 21, wherein: said wetting receptacle comprises a flexible material; and said holding means is provided on said forward portion to be gripped by a user through said flexible material of said wetting receptacle.
 - 23. The wetting apparatus according to claim 22, wherein; said forward portion of said wetting fluid container presents a forward edge;
 - said tear line extends rearwardly from said forward edge; said tab is a first tab which extends rearwardly from said forward edge of said forward portion on a first side of said tear line and is of such dimensions as to project from said inlet of said wetting receptacle;
 - said holding means for holding said wetting fluid container against said action of said pulling force applied to said first tab is a second tab which extends forwardly from said forward edge on a second opposite side of said tear line; and
 - application of a predetermined rearward pulling force on 65 said first tab relative to said second tab causes said tear line to tear and said wetting fluid to discharge from said

- wetting fluid container into said wetting fluid receiving area of said wetting receptacle.
- **24**. The wetting apparatus according to claim **1**, wherein said wetting fluid container comprises a sachet.
- 25. The wetting apparatus according to claim 1, wherein said wetting fluid is water or a saline solution.
- **26**. The wetting apparatus according to claim **25**, wherein said wetting fluid container comprises a material which is impermeable to ethylene oxide and water or saline solution.
- 27. Wetting apparatus for wetting a hydrophilic urinary catheter prior to use, said urinary catheter having an insertable length and having a hydrophilic outer surface on at least said insertable length, said wetting apparatus comprising:
 - a catheter package comprising a sealed elongated volume that contains said hydrophilic urinary catheter, said sealed elongated volume having at least one chamber that surrounds at least a portion of said insertable length of said hydrophilic urinary catheter; wherein:
 - said elongated volume is provided with an inlet which is in fluid communication therewith;
 - said at least one chamber comprises a first chamber containing a wetting fluid container having wetting fluid therein;
 - said wetting fluid container is integrated with said elongated volume in a releasably secured manner, being releasably secured in said inlet of said wetting receptacle by insertion of at least a forward portion thereof in said inlet through a friction fit, said forward portion of said wetting fluid container presenting a discharge portion;
 - said wetting fluid container comprises a rearward portion which projects from said inlet;
 - said wetting fluid container comprises means for applying a predetermined condition to said discharge portion to open said wetting fluid container to enable said wetting fluid to discharge from said wetting fluid container to wet at least a tip portion of said insertable length of said hydrophilic urinary catheter; and
 - said first chamber is defined by a restriction in said elongated volume.
- 28. The wetting apparatus according to claim 27, wherein said wetting fluid container contains sufficient wetting fluid to fill said elongated volume to a level for wetting said at least said insertable length of said hydrophilic urinary catheter.
- 29. The wetting apparatus according to claim 27, wherein said wetting fluid container is made of aluminum foil, poly(vinylidene chloride) or a metallized film.
- 30. The wetting apparatus according to claim 29, wherein said metallized film comprises metallized poly(ethylene terephthalate).
- 31. The wetting apparatus according to claim 27, wherein said wetting fluid container is fully contained within said first chamber.
 - **32**. The wetting apparatus according to claim **27**, wherein: said elongated volume is formed of a flexible material; and
 - said wetting fluid container has a discharge portion that opens on application of a predetermined force to said wetting fluid container through said flexible material of said elongated volume.
- **33**. The wetting apparatus according to claim **27**, wherein said rearward portion comprises at least a part of said means for applying said predetermined condition.
- **34**. The wetting apparatus according to claim **33**, wherein said discharge portion comprises an area of weakness in

12

material of said forward portion of said wetting fluid container which on application of a predetermined force thereto opens.

- 35. The wetting apparatus according to claim 34, wherein at least a part of said means for applying said predetermined 5 condition comprises a tab at said rearward portion of said wetting fluid container which on application of a predetermined pulling force thereto causes said predetermined force to be applied to an area of weakness in material of said forward portion of said wetting fluid container.
- **36**. The wetting apparatus according to claim **35**, wherein said area of weakness in said material of said forward portion of said wetting fluid container is a tear line which is adapted to be torn on application of said predetermined pulling force to said tab.
- 37. The wetting apparatus according to claim 36, wherein said means for applying said predetermined condition further comprises holding means for holding said wetting fluid container against action of said predetermined pulling force applied to said tab.
 - 38. The wetting apparatus according to claim 37, wherein: said wetting receptacle comprises a flexible material; and said holding means is provided on said forward portion to be gripped by a user through said flexible material of said wetting receptacle.
 - **39**. The wetting apparatus according to claim **38**, wherein: said forward portion of said wetting fluid container presents a forward edge;
 - said tear line extends rearwardly from said forward edge; said tab is a first tab which extends rearwardly from said 30 forward edge of said forward portion on a first side of said tear line and is of such dimensions as to project from said inlet of said elongated volume;
 - said holding means for holding said wetting fluid container against said action of said pulling force applied 35 to said first tab is a second tab which extends forwardly from said forward edge on a second opposite side of said tear line; and
 - application of a predetermined rearward pulling force on said first tab relative to said second tab causes said tear 40 line to tear and said wetting fluid to discharge from said wetting fluid container into said elongated volume.
- **40**. The wetting apparatus according to claim **27**, wherein said wetting fluid container comprises a sachet.
- **41**. The wetting apparatus according to claim **27**, wherein 45 said wetting fluid is water or a saline solution.
- **42**. The wetting apparatus according to claim **41**, wherein said wetting fluid container comprises a material which is impermeable to ethylene oxide and water or saline solution.
- **43**. A wetting apparatus for wetting a hydrophilic urinary 50 catheter prior to use, said urinary catheter having an insertable length and having a hydrophilic outer surface on at least said insertable length, said wetting apparatus comprising:
 - a first chamber for receiving at least said insertable length of said hydrophilic urinary catheter therein; and
 - a second chamber containing a wetting fluid; wherein: said first chamber is adapted for fluid communication with said second chanter;
 - said first chamber is provided with an inlet which is in fluid communication therewith, said inlet being adapted 60 to receive at least a portion of said second chamber for passage of said wetting fluid into said first chanter;
 - said second chamber is adapted for fluid communication with said first chamber, said second chamber having a discharge portion that opens upon application of a 65 predetermined condition thereto to release said wetting fluid; and

14

- said second chamber has at least a portion adapted for insertion into said inlet of said first chamber, said second chamber being releasably secured in said inlet of said first chamber by insertion of at least a forward portion of said second chamber in said inlet, said forward portion of said second chamber presenting said discharge portion having a discharge opening.
- 44. The wetting apparatus of claim 43 wherein: said second chamber is integrated with said first chamber in a releasably secured manner; and
- at least said discharge opening is disposed within said first
- **45**. The wetting apparatus of claim **44**, wherein said second chamber contains sufficient wetting fluid to fill said first chamber to a level for wetting said at least said insertable length of said hydrophilic urinary catheter.
- **46**. The wetting apparatus of claim **44**, wherein said second chamber is made of aluminum foil, poly(vinylidene chloride) or a metallized film.
- **47**. The wetting apparatus of claim **46**, wherein said metallized film comprises metallized poly(ethylene terephthalate).
 - **48**. The wetting apparatus of claim **44**, wherein: said first chamber is formed of a flexible material; and said discharge opening opens on application of a predetermined force to said second chamber through said flexible material of said first chamber.
- **49**. The wetting apparatus of claim **48**, wherein said discharge opening comprises an area of weakness in material of said second chamber which on application of a predetermined force thereto opens.
- **50**. The wetting apparatus of claim **44**, wherein said second chamber is fully contained within said first chamber.
- **51**. The wetting apparatus of claim **43**, wherein said second chamber contains sufficient wetting fluid to fill said first chamber to a level for wetting said at least said insertable length of said hydrophilic urinary catheter.
- **52**. The wetting apparatus of claim **43**, wherein said second chamber is made of aluminum foil, poly(vinylidene chloride) or a metallized film.
- **53**. The wetting apparatus of claim **52**, wherein said metallized film comprises metallized poly(ethylene terephthalate).
- **54**. The wetting apparatus of claim **43**, wherein said second chamber is releasably secured in said inlet of said first chamber through a friction fit between said second chamber and said inlet of said first chamber.
- **55**. The wetting apparatus of claim **54**, wherein said second chamber comprises means for applying said predetermined condition to said discharge portion to open said second chamber.
- **56**. The wetting apparatus of claim **55**, wherein said forward portion of said second chamber is positioned in said inlet of said first chamber; and
 - said second chamber comprises a rearward portion which projects from said inlet of said first chamber.
- 57. The wetting apparatus of claim 56, wherein said rearward portion comprises at least a part of said means for applying said predetermined condition.
- **58**. The wetting apparatus of claim **57**, wherein said discharge portion comprises an area of weakness in material of said forward portion of said second chamber which on application of a predetermined force thereto opens.
- **59**. The wetting apparatus of claim **58**, wherein at least a part of said means for rearward portion of said second chamber which on application of a predetermined pulling force thereto causes said predetermined force to be applied

to an area of weakness in said material of said forward portion of said second chamber.

- **60**. The wetting apparatus of claim **59**, wherein said area of weakness in said material of said forward portion of said second chamber is a tear line which is adapted to be torn on 5 application of said predetermined pulling force to said tab.
- **61**. The wetting apparatus of claim **60**, wherein said means for applying said predetermined condition further comprises holding means for holding said second chamber against action of said predetermined pulling force applied to 10 said tab.
 - **62**. The wetting apparatus of claim **61**, wherein: said first chamber comprises a flexible material; and said holding means is provided on said forward portion to be gripped by a user through said flexible material of 15 said first chamber.
 - **63**. The wetting apparatus of claim **62**, wherein: said forward portion of said second chamber presents a forward edge;

said tear line extends rearwardly from said forward edge; 20 said tab is a first tab which extends rearwardly from said forward edge of said forward portion on a first side of

16

said tear line and is of such dimensions as to project from said inlet of said first chamber;

- said holding means for holding said second chamber against said action of said pulling force applied to said first tab is a second tab which extends forwardly from said forward edge on a second opposite side of said tear line; and
- application of a predetermined rearward pulling force on said first tab relative to said second tab causes said tear line to tear and said wetting fluid to discharge from said second chamber into said first chanter.
- **64**. The wetting apparatus of claim **43**, wherein said second chamber comprises a sachet.
- **65**. The wetting apparatus of claim **43**, wherein said wetting fluid is water or a saline solution.
- **66**. The wetting apparatus of claim **65**, wherein said second chatter comprises a material which is impermeable to ethylene oxide and water or saline solution.

UNITED STATES PATENT AND TRADEMARK OFFICE CERTIFICATE OF CORRECTION

PATENT NO. : 7,087,048 B2 Page 1 of 1

APPLICATION NO.: 10/762034
DATED: August 8, 2006
INVENTOR(S): Anette Israelsson et al.

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

Title page 3, item 56 first column, in the Hellstrom entry, "1991.ur" should be -- 1991. --; second column, in the Perkash entry, "catheterisatin" should be

-- catheterisation --;

in the Vaidyanathian entry, "preforming" should be -- performing --.

Column 1, line 7, "of," should be -- of copending, --

Column 10, line 31, "alter" should be -- after --.

Column 13, line 58, "chanter;" should be --chamber; --; line 62, "chanter;" should be -- chamber; --.

Column 14, line 65, after "for" should be inserted -- applying said predetermined condition comprises a tab at said --.

Column 16, line 12, "chanter." should be -- chamber. --.

Column 16, line 19, "chatter" should be -- chamber --.

Signed and Sealed this

Ninth Day of January, 2007

JON W. DUDAS
Director of the United States Patent and Trademark Office
